

***FIRE HYDRANT FLOW TESTING
MAY 19, 2026 UNTIL COMPLETED
EVERY: TUESDAY, WEDNESDAY, & THURSDAY***

The Dadeville Fire Department will conduct fire hydrant flow testing beginning Tuesday, May 19, 2026 and will continue until completion. This fire hydrant flow testing maintenance is done to ensure that the fire hydrants are working properly. This required testing also benefits the fire department's fire protection rating.

While this testing is in progress, motorists should be aware of the firefighter(s) working in close proximity of the streets and roads. For the safety of the firefighters and motorists, motorists are urged to slow down and proceed with caution as extreme water in the roadway from this flow testing could cause vehicles to hydroplane.

During hydrant flows in your areas, the water may become discolored due to sediment in the pipes being agitated from the larger-than-normal amount of water that will be flowing through the system. If this occurs, simply run the tap until the water runs clear. It is advised that you avoid doing laundry for several hours if you see hydrants in your area being tested.
